I. INTRODUCTION

The purpose of this thesis was to design a menu-driven data-base oriented decision support system to manage the various resource accounts controlled by the Administrative Science Department, Naval Postgraduate School. The myriad management systems currently in use will be consolidated into one comprehensive system, eliminating much of the manual manipulation of data presently required to generate financial reports. This computerized system will be capable of producing reports to meet existing internal reporting requirements while providing the ability to generate additional reports and queries as needed. The menu-driven format will require minimal computer knowledge by the user to operate the data-based system. The system application is written in dBASE IV, implemented on a MS-DOS-based personal computer.

A. REVIEW OF CURRENT SYSTEMS

With the dwindling resources available to all DOD activities, the need to effectively use all available dollars is more important than ever. In order to manage resources effectively, a properly designed Financial Management Information System (FMIS) will be indispensable.

The need for a resource management information system in the AS Department has been examined by Renner [Ref. 1]. The study conducted a structured analysis to determine the computing needs of the AS Department. This analysis defined three different sub-systems:

- Financial
- Personnel
- Property

to keep track of all information pertaining to the management and control of departmental activities. Booker [Ref. 2] developed and implemented a prototype system in 1986 in part as a feasibility study, implementing some of the features of each subsystem outlined in the previous analysis. The prototype proved the system feasible by showing that many of the manual procedures could be automated. Sexton [Ref. 3] developed and implemented the Property Management System (PMS) to support the management and accountability of the departmental property on a microcomputer.

Other information systems currently in use were created by the operators and users of the information using personal computer (PC) based software that they were familiar with. The result is an assortment of different information systems for tracking financial transactions and producing reports. Because both database and spreadsheet programs are in use, there is much duplication of data entry to create the reports required by management. Users familiar with one software

program are typically not familiar with the other software program, limiting the ability for any user to access the information he or she requires.

B. PURPOSE

The purpose of this thesis was to develop a personal computer-based Resource Management Information System for the management of the many funding accounts controlled by the Administrative Sciences Department. The central objective was to integrate accounting transactions currently performed in several different offices using different software programs, into a single all-encompassing Resource Management Information System.

The main requirement of the system was to maintain financial accountability for the numerous fund accounts entrusted to the department. The ability of the system to provide management reports, geared toward both internal and external reporting requirements, was crucial to the development of the system. The FMIS had to be efficient and responsive to requests for information. The FMIS would track financial transactions involving labor, travel, and CPTAR accounts.

The project was divided into five phases. The first phase consisted of a survey of the user's requirements. This included understanding the accounting system, both in terms of internal processes and external requirements.

The second phase was the selection of a software package that met three criteria; (1) readily available at NPS, (2) an inherent capability to store and process large amounts of data and, (3) would provide an easy-to-learn and user-friendly interface. Ashton-Tate's dBASE IV, a database management system, met the preceding requirements and was chosen as the project's software package.

Phase three involved database development and report definition. Phase four involved installing the prototype FMIS on AS Department PC's for testing. Both phases required close interaction with the users.

The fifth phase involved actual implementation of the system at the beginning of FY 91. It commenced with entry of the new fiscal year's data and manual comparison to assure the accuracy and reliability of the system. Close monitoring of the operational effectiveness continued through the first quarter of the fiscal year.

II. SYSTEMS ANALYSIS AND DESIGN

Prior to development of the FMIS an understanding of the current practice was required. The informational needs of the users were surveyed and the goals of the FMIS were defined. A framework was then developed and a software package chosen. Once the databases were defined, the desired reports to be generated were designed. The final requirement was the preparation of an application to implement the FMIS.

A. SYSTEM REQUIREMENTS AND ANALYSIS

1. Review of Current System

The AS Department is responsible for maintaining approximately 35 separate fund accounts. The nature of these funds include the day-to-day support of the department, including supplies, staff/faculty salaries, funding from external sources in support of scholarly research performed by faculty members, and other staff/faculty support funding. Within each account, all obligations including salaries, travel and OPTAR expenditures, must be tracked to meet the external financial reporting requirements, and just as importantly, to enable financial decision making.

The management of all accounts was being done separately, by those in charge of maintaining direct and indirect funds and reimbursable account status along with

supply requisition status, at several desks using personal computers and various software products. While the processes were "computerized", there had been no integration of the various functions. In effect, it was necessary to maintain lists of transactions for manual compilation into several "master" computer spreadsheets to produce summary reports. This process was extremely labor intensive in that data was repetitively processed at more than one point to generate reports for managerial use.

2. Survey of User's Requirements

To begin designing the Administrative Sciences (AS) Department's Management Information System (FMIS), an extensive survey was conducted to determine specific user needs, to get an understanding of the financial accounting system within which the FMIS was to operate, to assess the current system in use by the department, and to select a software package considered both powerful and flexible enough to meet the system requirements. This was accomplished through numerous interviews with key personnel tasked with the financial management responsibility within the department. The main requirement of the FMIS was established: To maintain financial accountability for the numerous fund accounts entrusted to the department from sources both internal to NPS and from outside the school, while providing an efficient, labor-saving means to do so.

3. Framework Development

The survey resulted in the development of a framework by which the FMIS was to be designed, and was defined as follows:

- The system would employ a Data Base Management System (DBMS) to enable data accumulation and to provide efficient report generation.
- A user-friendly menu-driven system requiring little technical knowledge of the software and computer operation.
- Adaptable for future installation on a Local Area Network and implementation of additional user specified modules.
- Developed using a software package that was readily available in the market, and as previously mentioned, provide the power and flexibility required for the defined system. dBASE IV was chosen for those reasons.
- Use PC/MS DOS based personal computers.

B. DATABASE AND REPORT SPECIFICATIONS

Once an understanding of the financial management function of the AS Department was obtained, the system framework defined, and a software package selected, the next step was to begin development of the FMIS.

1. Database Specifications

Databases were developed and their relationships established. This was accomplished through user interviews in which six logical database files and their specific data elements were defined. It was also necessary to develop one additional temporary database file to enable batch updating. Each was to be developed as a separate module, with an eye

towards ensuring that relationships could be established as necessary to take advantage of the power afforded by a relational database structure.

As depicted in Figure 2.1, the data files constitute a hierarchy. The Accounts database is considered to be the "master" database file because all fund accounts and their respective initial balances are established there. Subordinate to the Accounts file is the Direct Accounts file. This was required to establish specific funding allotments to individual accounts controlled by principal investigators. Subordinate to both the Accounts and Direct Accounts file; the Labor, Supply and Travel databases were established to accumulate transactional processing data for later report preparation drawing on account information located in both the Account and Direct Account databases. A Personnel file was established to maintain personal staff/faculty information, in particular, salary information for use in payroll report processing. Further, relationships were established between the Accounts and Personnel data files and the Labor, Supply and Travel files to enable account and personnel validation during transaction data entry. This was accomplished through use of user-defined functions, a feature of dBASE IV. Finally, as mentioned above, a temporary database file was created to allow batch updating of the Labor database so that actual payroll amounts could be stored with each record.

Figure 2.1 Database Hierarchy

Figure 2.1 depicts the various relationships that were established to take advantage of the relational structure afforded by dBASE IV. Specifics regarding the above data files and their elements are contained in the Data Dictionary, Appendix A.

In conjunction with the definition of databases, and to facilitate data entry into the system, a formatted data entry screen was created for each data file. They were based on the format in which raw data was obtained in an effort to facilitate data entry.

2. Report Specification

Once the database files and their attributes were defined, report definition began. This was also accomplished with direct user input. Three main categories of reports were developed:

- Summary reports - management reports aimed toward providing bottom-line fund status.
- Audit reports - reports supporting the Summary Reports and providing specific transaction information.
- Status/Tickler reports - reports geared toward supporting individual transactions, e.g., supply status listings, delinquent travel claims listings, etc.

The report generating feature of dBASE IV enabled development of all report requirements with the exception of the summary reports. Because this feature precludes the simultaneous use of multiple database files, it was necessary to use the dBASE IV programming language to create these reports.

A listing of all reports and their specific file names and related views is provided in Appendix A, Reports. Additionally, dBASE programming code documentation for the summary reports is provided in Appendix B, Program Listings.

C. DEVELOPMENT AND IMPLEMENTATION

1. Database Development

Developing a database requires three steps. Data requirements for the organization as a whole must be identified. The key entities, attributes, and relationships

that constitute the organization's data must be identified. The next step is to define the logical relationships between the data, a process known as data modeling. These relationships must be represented in the database. The third step involves organizing the database in such a way as to optimize access, flexibility, and efficiency.

2. Database Characteristics

A database is a set of data organized to serve many applications efficiently by centralizing the data and minimizing redundant data. dBASE IV, a database management system (DBMS), is a popular PC-based software package that accomplishes this task.

The data resides physically on a computer disk in the form of data elements. dBASE IV acts as the interface between application programs and the physical data files. Application programs request data elements from the database. When the application program calls for a data element like travel advances, dBASE IV finds this element in the database and presents it to the application program. The software package incorporates all of the computer languages required to execute the requirements of the user in a user-friendly application. The end user is relieved of the task of understanding where and how the data is actually stored. This permits the end user to issue a few simple queries to produce reports.

Every information system must keep track of certain entities (e.g., faculty, supply requisitions) that have certain attributes (e.g., address, cost) and certain relations among them (e.g., temporary faculty, overdue requisitions). Previously this could have been a 3 x 5 card file system. There are three different ways in which the DBMS keeps track of entities, attributes, and relations.

Hierarchical DBMSs present data to users in a tree-like structure. To the user, each record looks like an organizational chart with an upper segment connected logically to a lower segment in a parent-child or one-to-many relationship, one parent and possibly many children. The data is physically linked to one another by a series of pointers that form chains of related data segments.

Network DBMSs are a variation of hierarchical DBMSs. Network structures depict data logically as many-to-many relationships. Network structures reduce redundancy and are often faster than hierarchical DBMSs but require many more pointers. Advantages to both types of DBMSs are organization and access to data, efficient processing of transactions, and the ability to have a large number of variable-length records. This makes them very good for structured routine request, but the access paths, directories, and indices must be specified in advance. But, this design has low flexibility and is programming intensive, time consuming, and difficult to install.

A relational model can relate any piece of information stored in one file to any piece of information stored in another file as long as the two tables share a common data element. In each file, the rows or tuples are unique records and the columns are fields. A relational database is highly flexible in regard to ad hoc inquiries, power to combine information from different sources, simplicity of design and maintenance, and the ability to add new data and records without disturbing existing programs and applications. A significant weakness of a relation database is processing efficiency. They are slow because they typically require many accesses to the data stored on the disk. This problem is significant only for large-volume transaction processing systems like airline reservation systems, and should not be significant in our application.

Logically defined, dBASE IV incorporates a relational database structure. Each database file or table consist of records (or rows) of information. Each record is divided into separate fields (or columns) of information. Forms are used to input data into files and reports are the familiar output. A one-to-one relationship among forms, database files, and reports is not required. dBASE IV can easily pull together information from separate database tables into a single report. Information may be added, deleted, or changed effortlessly.

3. Database Generation

The final step before system installation was to tie the various modules of the FMIS together into a menu-driven system. This was accomplished using the dBASE IV Applications Generator. This powerful feature enabled the creation of pull-down menus for all aspects of the system's use.

Within the application, each database file and the various operations associated with it are accessed through individual menus. Additionally, a "Tools" menu is included to provide several utilities for data file maintenance, e.g., database backup and restoration, rebuilding of corrupted indexes, etc. Application documentation is provided in Appendix C, Application Documentation.

4. System Implementation

The FMIS was installed on two personal computers in the AS Department two weeks prior to the beginning of FY 91. This provided the opportunity to test the system with sample data while at the same time, giving the user hands-on operating experience. Several minor errors were detected during the period and corrected. As to be expected, this also resulted in additional user requirements (additional reports) as the power of the FMIS became apparent.

Because data entry to the system was accomplished in two different locations during the test period, it was necessary to produce two different versions of the system (a

temporary measure until installation of the proposed local area network (LAN)). The main system was installed in the AS Department office; more easily accessible to key supervisory personnel. All data entry, with the exception of supply transactions, and report generation is accomplished at this location. A second system, limited to supply support, was installed at another location where supply services are provided to staff and faculty personnel. This system differed in that complete access to the Supply database and limited access to the Accounts database (to verify existence Job Order Numbers for validation purposes) was provided. The user can perform data entry and print various requisition status reports from this location. Also, because report generation is performed at the main location, and account and personnel validation is performed at the other using updated account and personnel information, it is necessary to share data between the two systems. Utilities were provided in each system's "Tools" menu for the import/export of updated data files.

The installation phase proved very successful. With the exception of the before mentioned errors, the program performed as designed. Extensive review of all reports by supervisory personnel indicated that all transactions were being processed correctly; balances, total obligations and individual transactions were accurately reflected.

The FMIS was well received by the user. A presentation of the nearly finalized version was made to the

Department Chairman and other key supervisory personnel and was accepted with suggestions for future development in subsequent thesis research. As a result, the system was put into use beginning with the new fiscal year and monitored closely during the first quarter for unforeseen processing errors. No significant problems were encountered.

Finally, a user's manual was prepared along with two backup copies of the system. With empty database files, the system will fit on a single 1.2 Megabyte floppy diskette. The user's manual is contained in Appendix D.

III. CONCLUSIONS

The Financial Management Information System is presently being utilized as a means of accounting for the many funded accounts the AS Department Chairman must keep track of. The users have indicated their satisfaction with the system and look forward to being able to track financial data with improved accuracy and timeliness.

Since the implementation of the FMIS at the beginning of Fiscal Year 1991, very small changes have been required to accomplish all of the goals set forth in the beginning. With the assistance of the user's manual, this thesis, and a basic knowledge of dBASE IV, this data based application could be easily adapted for other departmental financial records.

Financial management was only one of three areas where PC-based computer applications would be beneficial. The Property Management System is currently providing a useful means of maintaining accountability for AS Department property. The users have expressed an interest in improving the property management system with more detailed reports and possibly integrated with the supply and personnel databases. Weaknesses in this system were not explored in this thesis and are left as possible areas for future study.

Although this system does have a limited personnel database, an improved or enhanced personnel database with

additional reports may provide potentially useful information to the department's decision makers.

Finally, as the users becomes more familiar with the reports available, new reports will be identified. This might entail adding new records to the existing databases but should not require significant modifications to this FMIS. With the implementation of a local area network tying together the different databases and their users, additional problems may surface requiring a person with knowledge of dBASE IV to correct.

In conclusion, the goal of this thesis was to deliver a satisfactory system that the users would be comfortable with and have this system installed to support the new fiscal year reporting requirements. This goal was accomplished with the Financial Management Information System.

APPENDIX D: USER'S GUIDE
TO THE ADMINISTRATIVE SCIENCE DEPARTMENT'S
FINANCIAL MANAGEMENT INFORMATION SYSTEM

A. INTRODUCTION

The purpose of this user's manual is to familiarize the user with the AS Department's Financial Management Information System (FMIS), as well as to provide some background information which may be used by more experienced personal computer users. Access to the various databases and reports is gained by selecting the desired action from pull-down menus. The system is very easy to use but does require some knowledge with regard to specific requirements at various data entry points. Wherever possible, these requirements are treated by the program as "multiple choice" entries in formatted data entry screens; that is, only allowed choices are available to the user. Also, the user should note that the built-in validation procedures also put limitations on data entry. These topics are addressed in this manual where appropriate. Finally, sample program "screens" are presented to aid in familiarization.

B. GETTING STARTED

Before running FMIS, the dBASE IV system program must be installed on a hard disk as specified in the dBASE IV

installation guide. Next, the FMIS system application files must be loaded onto the hard disk and stored in a sub-subdirectory of the dBASE IV directory. The hard disk storage space requirements are as follows: (1) dBASE program - 3.5 to 4.5 MB, and (2) FMIS - 1.5 MB. Therefore, a minimum of 10 Megabytes of available hard disk storage space is required. If the system is used by other departments with large databases, more hard disk storage space is recommended.

To run the application, simply type "FMIS" at the DOS prompt. The FMIS.BAT file will automatically access the

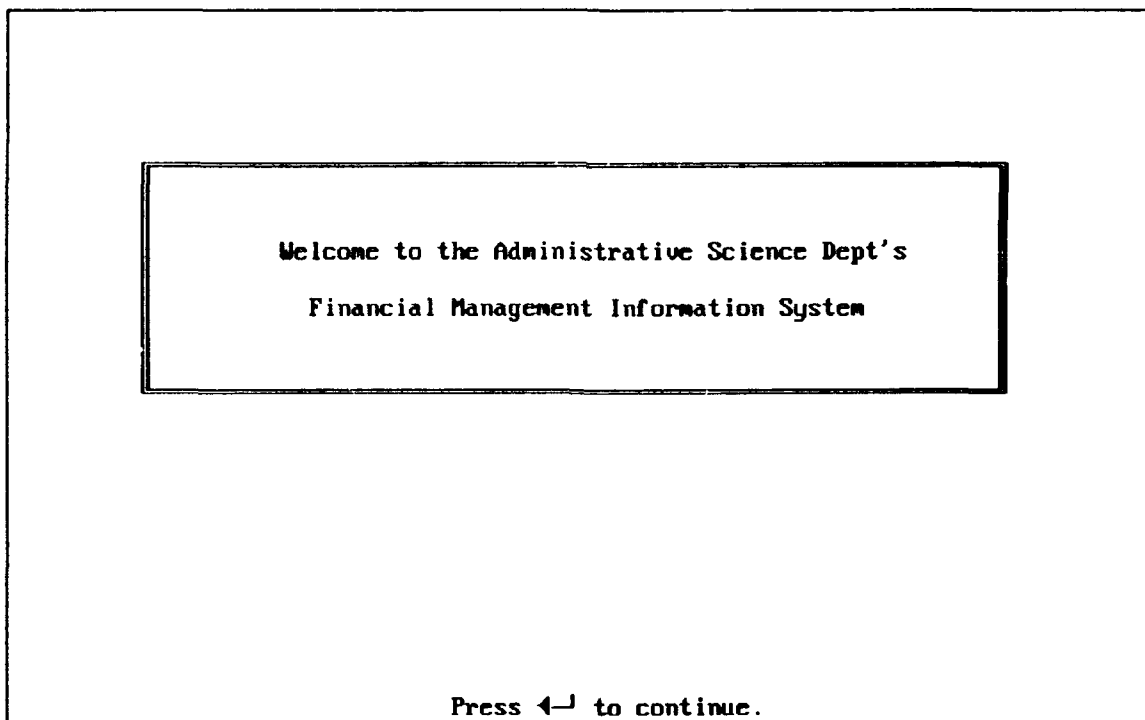

Figure D.1

appropriate subdirectories, start dBASE IV and execute the application. The "Welcome Screen" (Figure D.1) will then

appear. A path command in the DOS autoexec.bat file should include the subdirectory in which the dBASE IV program files are stored. Figure D.2 provides an example startup batch file.

Another way to start the application is from the dBASE Control Center. This is done by highlighting the application name "RMS" under the Application column, pressing enter and responding appropriately to the on screen prompts.

Finally, the system can also be started from the dBASE "dot prompt". This is done by entering "DO RMS" and pressing the Enter key.

C. MENUS

Each functional area or module, i.e., Accounts, Personnel, Supply, etc., is displayed across the top of the screen. Through each menu, all operations of the system, from data

```
FMIS.BAT

ECHO OFF
CD C:\DBASE
CD C:\DBASE\FMIS
DBASE RMS

NOTE: THE DBASE IV PROGRAM FILES ARE STORED IN THE
"DBASE" SUBDIRECTORY. THE FMIS SYSTEM FILES ARE
STORED IN THE "FMIS" SUBDIRECTORY. THE "DBASE RMS"
COMMAND EXECUTES BOTH THE DBASE PROGRAM AND THE
APPLICATION.
```

Figure D.2 Startup Batch File

entry to report preparation, can be performed. As can be seen on the screen (Figure D.3), the menu for accessing the Accounts module is displayed. Other modules may be accessed by pressing the left or right arrow keys. As these keys are pressed, each newly selected module's menu will pop-up. When the desired menu is displayed, item selection may be made by pressing the up or down arrow keys. When the desired selection is highlighted, pressing the Enter key will initiate the action. Table D.1 is a summary of the keys used to navigate the pull-down menus.

Table D.1 Keys Used to Navigate Pull-Down Menus.

- Left arrow key moves to the module option to the left.
 - Right arrow key moves to the module option to the right.
 - Down arrow moves down to the next available menu option on the current pull-down menu.
 - Up arrow moves up to the next available menu option on the current pull-down menu.
 - PgDn moves to the last available option on the current pull-down menu.
 - End same as PgDN.
 - PgUp moves to the first available option on the current pull-down menu.
 - Home same as PgUp.
 - Enter selects the currently highlighted option.
 - First letter of any option selects that option.
 - Esc exits the system or backs up to the Accounts menu when in the Direct Accounts menu.
-

As mentioned above, access to each module is accomplished through its menu. Specific operations include adding,

```
ACCOUNTS  PERSONNEL  SUPPLY  LABOR  TRAVEL  TOOLS  EXIT

ADD NEW ACCOUNTS
VIEW/EDIT ACCOUNTS
REMOVE MARKED ACCOUNTS
PRINT EXPENSE SUMMARY
PRINT OTHER LABOR REPORT
-----
DIRECT FUND ALLOCATION

Position: ←↑ Select: ← Help: F1
```

Figure D.3 Accounts Menu

editing, and deleting data, report generation and general database maintenance. Data entry and editing commands are the same for each module. For example, making an "Add Data" selection in any module will call up a formatted data entry screen for inputting data. The data entry process, that is, keying in the data, is performed in the same manner for each.

It is important to note that two methods are employed to help alleviate input errors during data entry and editing. The first is a validation process. This occurs when entering

data into the Job Order Number (JON) and Principal Investigator (PI) fields of the data entry formats of the Direct Account, Supply, Travel and Labor modules. The system will not allow the user to create a new record unless a valid JON and PI code is entered in the appropriate field. The second method is that of creating "multiple choice" entry fields. This allows the input of only predetermined entries. A record cannot be established with other than one of those choices. The following sections will discuss each module and point out specific data entry requirements or processes.

1. The Accounts Module

The Accounts module is used for management of the various fund accounts. Within this module accounts and their related authorized funding levels are established and maintained. Also, summary obligation reports are generated from this menu. Lastly, this menu also allows entry to the Direct Accounts Module, a subsidiary of the Accounts Module. Figure D.3 depicts the system with the Accounts menu active.

a. Add New Accounts

To add new accounts, select "Add New Accounts" from the Accounts menu above. Making this selection will display a formatted data entry screen (see Figure D.4). Keyboard commands for data entry are listed in Table D.2.

It is important to note two aspects of entering data in this screen. First, the second data entry field asks

Table D.2 Navigation and Editing keys for Data Entry/Editing Screens

- Enter key in the first data field without entering data will result in the return to the Account menu without saving the record.
- Enter key after data is entered completes entry and moves to next field.
- Down arrow key moves cursor down.
- Up arrow key moves cursor up.
- Right arrow key moves cursor right one character.
- Left arrow key moves cursor left one character.
- PgDn key moves down one record on edit screen or one screenful where annotated in screen format.
- PgUp key moves up on record on edit screen or one screenful where annotated in screen format.
- Del key deletes character over cursor.
- Backspace key moves left one character, erasing along the way.
- Ctrl-End keys pressed simultaneously saves the new record or editing changes.
- Ctrl-Y keys pressed simultaneously deletes all characters to right of cursor.
- Ctrl-U keys pressed simultaneously marks record for deletion.
- Ins key switches between Insert and Overwrite modes.
- Home key moves to first character in current field.
- End key moves to last character in current field.
- Tab key moves to next field.
- Shift-Tab keys pressed simultaneously moves to previous field.
- Esc key leaves current record without saving record or changes if editing.

for account type. Enter "R" for Reimbursable, "O" for Direct/Indirect, and "X" for labor accounts not directly managed but charged by the department. Signifying "X" will segregate all transactions citing the account's JON from summary reporting.

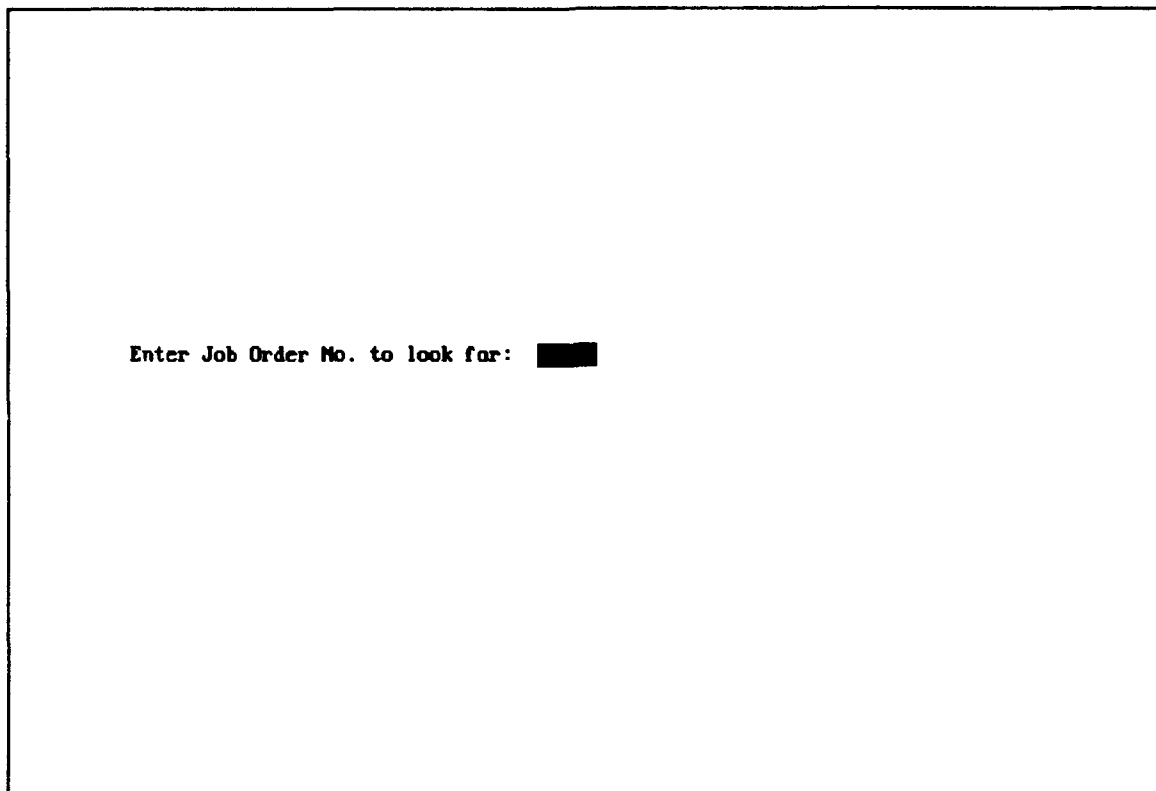

Enter/Edit Account Information			
Job Order No: <input type="text"/> (R) reimbursable/(O)ther/(X)tra: <input type="checkbox"/> PI: <input type="text"/>			
Sponsor: <input type="text"/>		MIPR: <input type="text"/>	
Title: <input type="text"/>			
Date Received: <input type="text"/> / <input type="text"/> / <input type="text"/>		Expiration Date: <input type="text"/> / <input type="text"/> / <input type="text"/> Dept. Expense (Y/N): <input type="checkbox"/>

<div style="display: flex; justify-content: space-between; font-family: monospace; font-size: small;"> Edit { D:\ndbaseii\temp2\ACCTS Rec EOF/50 File Num </div>			

Figure D.4 Add New Accounts Screen

Total obligations for these labor charges are reported in the "Other Labor Report", a menu option in this module. Second, the JON entry field is used as a validation check by the Direct Account, Supply, Labor and Travel modules. An incorrect JON may prohibit transaction entry in one of those modules.

b. View/Edit Accounts

To view or edit account information, select "View/Edit Accounts". Once this selection is made, the search screen displayed in Figure D.5 will appear. This screen allows you to specify the JON you wish to view/edit, and will cause the system to go directly to that record and display its

Enter Job Order No. to look for:

Figure D.5 Search Screen for Viewing/Editing Account Data File

data. If the JON entered is not found during the search, a message will appear and ask you to try again. Pressing Enter with no entry will result in the display of the first sorted JON.

Each record will be displayed by a view/edit screen as shown in Figure D.6. New records may not be added from this or any edit screen in the system. Commands listed in Table D.2 are also used for editing records.

Deleting a record is a two-step operation. First, the Ctrl-U command is used in the editing screen to mark the record(s) for deletion. Once the record has been marked, other records can then be viewed or edited. The Ctrl-End key

Enter/Edit Account Information	
Job Order No: 01	(R)eimbursable/(O)ther/(E)(X)tra: <input checked="" type="checkbox"/> PI: 156H

Figure D.6 Account View/Edit Screen

is then used when all editing is complete. This saves the deletion mark with the record. The record can be unmarked by returning to the edit screen, selecting the record and using the Ctrl-U command. The second step in the deletion process is described below.

c. Remove Marked Records

The final step in deleting a record(s) is by selecting the "Remove Marked Records" option from the Accounts menu. This will permanently remove each marked record from the database and automatically perform any necessary data file maintenance.

d. Reports

Two report options are available in the Account module. Either report may be generated by highlighting the desired report and pressing the Enter key.

e. Direct Fund Allocation

The purpose of the Direct Accounts module is to set up fund authorization to Direct-Funded research project

```

Figure D.9 Personnel Menu

screen. Once again, deleting a record is a two step process. The record(s) to be deleted must be marked. Then the "Remove Marked Allocations" option should be selected to remove the record from the data file.

One report is available from within the Direct Accounts Module. It is generated by selecting the "Print NA Summary" option.

2. The Personnel Module

The Personnel module (Figure D.9) provides the ability to maintain personal information about AS Department personnel (faculty and staff) while storing data used by the other system modules for both relational and validation purposes.

a. Add New Personnel

Creating a new record in this module requires use of two screens for data entry. Figures D.10 and D.11 show the data entry screens to establish a new employee record. When in screen one, access screen two by pressing the PgDn key. The new screen will appear and the cursor will be positioned in the "Remarks" field. To return to screen one, press the PgUp key, or to add additional new records, press the PgDn key.

The "Remarks" field in the second screen makes use of a Memo field. The memo field is a free-format area to enter a block of text. No specific entry format is required. To enter a remark, press the F9 key. Information can be typed directly into the field, however, it will start to "scroll" out of the "Remarks" window as the space is filled. Pressing the F9 key again will open the Memo field so that all data entered may be viewed or edited. Pressing F9 again will close the field. To save the entered information, press the Ctrl and End keys simultaneously. To add additional records press the PgDn key, or to save the new record and return to the Personnel menu, press the Ctrl and End keys a second time.

There are two data entry fields that warrant special attention. The "Principal Investigator" (PI) field is used by the Direct Accounts, Supply, Travel and Labor modules for validation purposes. Also, the "ID Code" field is used by the Labor module to extract information such as name and base

Figure D.11 Add New Personnel - Screen 2

d. Reports

Three report options are available and may be selected from the Personnel menu by highlighting the desired report option and pressing the Enter key.

3. The Supply Module

The purpose of the Supply module is to record transaction information for each procurement or requisition action carried out by the department. In addition to the financial data collected, it also provides tools for the supply clerk to facilitate requisition processing, follow-up and validation.

ACCOUNTS	PERSONNEL	SUPPLY	LABOR	TRAVEL	TOOLS	EXIT

Figure D.12 Supply Menu

a. Add Supply Transactions

Selecting "Add New Transactions" from the menu as displayed in Figure D.12 will allow recording of each supply requirement. The data entry screen, as shown in Figure D.13, will validate the JON and PI field entries against the Account and Personnel data file to ensure that the account and the principal investigator have been established in the system.

In the "Category" field, there are two categories that are currently tracked. They are honorariums and contract support. To enable summary reporting of honorariums and contract support, enter "HO" or "CS" respectively. Other category codes as required may be entered in this field.

Enter/Edit Supply Transaction Information

Figure D.13 Add New Transaction Menu

b. View/Edit Transactions

Selecting "View/Edit Transactions" from the Supply module menu will allow viewing or editing of individual transactions. A search screen allows a search by document number. Editing may then be accomplished.

c. Remove Marked Transactions

Selecting this option will remove from the data file those records previously marked for deletion.

d. Reports

Several reports are available in this module and may be selected by highlighting the desired option and pressing the Enter key.

4. The Labor Module

The purpose of the Labor module is to allow for recording of all payroll actions for financial reporting purposes. The module also maintains payroll data for individual employees including pay-to-date, hours worked, leave taken, etc.

a. Add Payroll Records

Selecting the "Add Payroll Records" from the Payroll module menu displayed in Figure D.14 will allow entry of payroll data into the system. Using the input from the "ID Code" field, the data entry screen (Figure D.15) will automatically extract name and base salary information from the Personnel module, make all required calculations, and store the name and total pay information into their respective fields. The name and total pay calculation will not appear on the screen until the user leaves the record.

b. View/Edit/Delete Payroll Records

Selecting "View/Edit/Delete Payroll Records" from the Labor module menu allows viewing, editing or deletion of individual payroll records. Again, a search screen based on last name is provided to allow direct access to specific records. The deletion process is different in this module in that its not the same two step process as described previously. When records are marked for deletion, they are permanently removed from the data file when the edit screen is

Figure D.15 Add Payroll Records Screen

a. Add New Travel Orders

Selecting "Add New Travel Orders" from the menu shown in Figure D.16 allows entry of new orders into the system. This data entry format uses two screens for data input as was the case in the Personnel module, and moving between screens is the same. Figures D.17 and D.18 show the two data entry screens used in the Travel module.

There are several fields that have specific data input requirements. The "Type of Travel" field provides a "multiple choice" format for inputting data. The options represent specific travel types that are tracked separately and are selected by pressing the Space bar. The selections

Figure D.18 Add Travel Orders - Screen 2

reindexing of data files and exporting/importing database files to and from the personal computer where supply transactions are processed (these are interim procedures while awaiting the network installation of the system). The various Tool options are selected from the menu displayed in Figure D.19.

a. Backup Data to Drive A

Selecting this option backups all database files. It does not, however, backup the memo field contained in the Personnel module. Prior to initiating this option, be sure that a formatted data disk is placed in the A drive.

Figure D.19 Tools Menu

b. Import Supply Data

Selecting "Import Supply Data" allows the importing of Supply data files from the desk where supply processing is conducted. Place the disk containing the data in the B drive and select the menu option. The old data files will be erased and the new data will be appended to the Supply database file. Reindexing will be accomplished automatically.

c. Rebuild Corrupted Indexes

This selection should be run whenever there is an unexpected loss of power as this might cause the indexes to become corrupted. This will cause the system to fail and display an error message specifying a problem with an index.

d. Restore Database Files from Drive A

Selecting this option will restore a previous backup of all system databases. Place the disk containing the files in drive A and make the selection. Any previous data file records will be deleted, the backup files read into the databases, and the database files reindexed.

e. Export Acct\Pers Data

This option allows for the exporting of updated account and personnel data file records required by the Supply module for validation of JON and PI data fields during transaction entry. Place a disk in the B drive and select menu item. The account and personnel database files will be copied to the disk.

7. Exit Menu

Selecting "Quit to DOS" from the Exit menu (Figure D.20) will leave the system and return you to the DOS prompt.

Figure D.20 Exit Menu
